Krupiński B. **Analysis of Mining of Protective Pillar under a Town.**
„Analiza eksploatacji filaru ochronnego pod miastem". Przegląd Górniczy. No. 1, 1955, pp. 3—11, 5 figs.

Conception of a mining safety depth (Knothe) and the interdependence between the thickness of seams mined and the safety depth of mining for various systems of mining (Lisowski) as fundamental principles for the estimation of the technical possibilities of the mining of a protective pillar under a town. These principles determine whether the system of mining is to be partial (pillar and stall or longwall) or complete with liquid goaf. A method of estimating the amount of damage expected to accrue as a result of the mining. Three ways of evaluating the coal in a pillar: 1) according to the amortization of the equipment; 2) according to the cumulative loss due to the work restriction placed on the mine caused by the protective pillars, and 3) according to the costs of the mine layout, considering the output lost through the protective pillar. An example of a balance sheet for determining the remunerability of mining a pillar under a town.
